Infineon

EiceDRIVER™ 1ED020I12-B2 Enhanced

Single channel isolated gate driver IC with DESAT, and Miller Clamp

Features

- Single channel coreless transformer isolated gate driver IC
- For 600 V/1200 V IGBTs and SiC MOSFETs
- 2 A typical rail-to-rail output current
- Integrated protection features, e.g.
  - V_{CEsat}-detection (*DESAT*)
  - Short circuit clamping
  - Active shut-down
  - Active Miller clamp
- 28 V absolute maximum output supply voltage
- 195/190 ns maximum propagation delay
- 100 kV/µs common mode transient immunity (CMTI)
- 12/11 V output undervoltage lockout (UVLO)
- Suitable for operation at high ambient temperature
- Certified according to UL 1577 with V_{ISO} = 3750 V (rms) for 1 min
- Basic insulation tested

Potential applications

- AC and brushless DC motor drives
- High voltage DC/DC-converter
- UPS-systems
- Solar inverter
- EV charging
- Commercial, construction and agricultural vehicles (CAV)
- Commercial air conditioner (CAC)
- Industrial power supply

PG-DSO-16-15

Product validation

Qualified for applications listed above based on the test conditions in the relevant tests of JEDEC20/22.

Description

The 1ED020I12-B2 is a galvanic isolated single channel driver in a PG-DSO-16-15 300 mil wide body package that provides an output current capability of typically 2 A.

All logic pins are 5 V CMOS compatible and could be directly connected to a microcontroller.

The data transfer across galvanic isolation is realized by the integrated coreless transformer technology.

The 1ED020I12-B2 provides several protection features like IGBT desaturation protection, active Miller clamping and active shut down.

Figure 3   1ED020I12-B2 (top view)

2.2   Pin functionality

GND1

Ground connection of the input side.

IN+ non-inverting gate driver input

IN+ control signal for the driver output if IN- is set to low. (The IGBT is on if IN+ = high and IN- = low)

A minimum pulse width is defined to make the IC robust against glitches at IN+. An internal pull-down resistor ensures IGBT off-state.

IN- inverting gate driver input

IN- control signal for driver output if IN+ is set to high. (IGBT is on if IN- = low and IN+ = high)

A minimum pulse width is defined to make the IC robust against glitches at IN-. An internal pull-up resistor ensures IGBT off-state.

/RST reset input

Function 1: Enable/shutdown of the input chip. (The IGBT is off if /RST = low). A minimum pulse width is defined to make the IC robust against glitches at /RST.

Function 2: Resets the DESAT fault-state of the chip if /RST is low for a time t_{RST}. An internal pull-up resistor is used to ensure /FLT status output.

3 Functional description

/FLT fault output

Open-drain output to report a desaturation error of the IGBT (/FLT is low if desaturation occurs)

RDY ready status

Open-drain output to report the correct operation of the device (RDY = high if both chips are above the UVLO level and the internal chip transmission is faultless).

VCC1

5 V power supply of the input chip

VEE2

Negative power supply pins of the output chip. If no negative supply voltage is available, all VEE2 pins have to be connected to GND2.

DESAT desaturation detection input

Monitoring of the IGBT saturation voltage (V_{CE}) to detect desaturation caused by short circuits. If OUT is high, V_{CE} is above a defined value and a certain blanking time has expired, the desaturation protection is activated and the IGBT is switched off. The blanking time is adjustable by an external capacitor.

CLAMP Miller clamping

Ties the gate voltage to ground after the IGBT has been switched off at a defined voltage to avoid a parasitic switch-on of the IGBT.During turn-off, the gate voltage is monitored and the clamp output is activated when the gate voltage goes below 2 V (related to VEE2). The clamp is designed for a Miller current up to 2 A.

GND2 reference ground

Reference ground of the output chip.

OUT driver output

Output pin to drive an IGBT. The voltage is switched between VEE2 and VCC2. In normal operating mode V_{OUT} is controlled by IN+, IN- and /RST. During error mode (UVLO, internal error or DESAT) V_{OUT} is set to VEE2 independent of the input control signals.

VCC2

Positive power supply pin of the output side.

3   Functional description

The 1ED020I12-B2 is an advanced IGBT gate driver that can be also used for driving power MOS devices. Control and protection functions are included to enable the design of high reliability systems.

The device consists of two galvanic separated parts. The input chip can be directly connected to a standard 5 V DSP or microcontroller with CMOS in/output and the output chip is connected to the high voltage side.

The rail-to-rail driver output enables the user to provide easy clamping of the IGBTs gate voltage during short circuit of the IGBT. So an increase of short circuit current due to the feedback via the Miller capacitance can be avoided. Further, a rail-to-rail output reduces power dissipation on a system-level.

The device also includes IGBT desaturation protection with /FLT status output.

The RDY status output reports if the device is supplied and operates correctly.
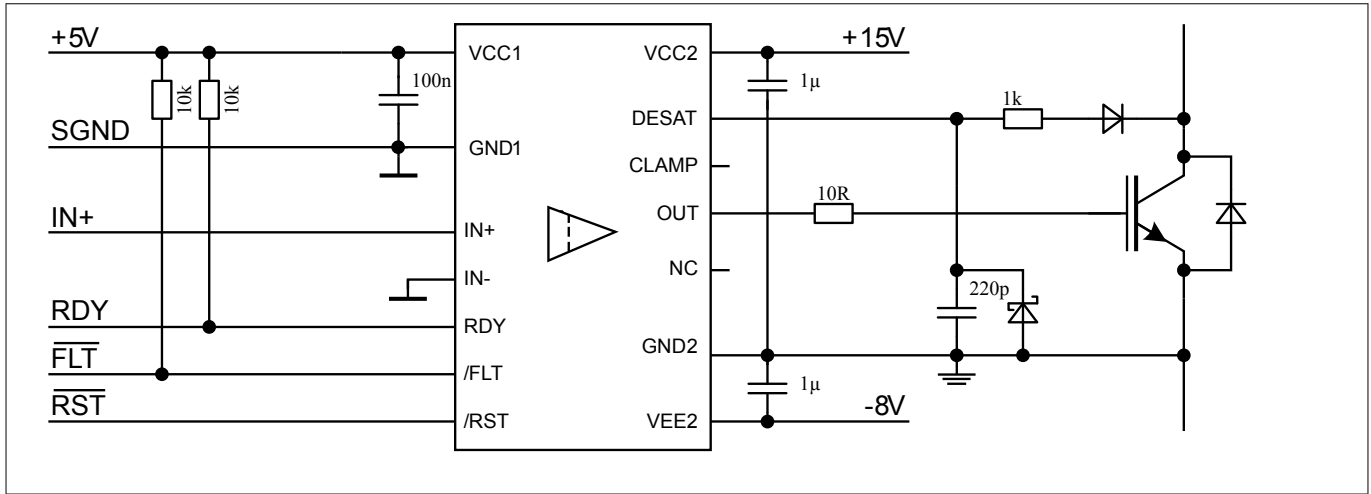

Figure 4   **Application example bipolar supply**

3.1   Supply

The driver 1ED020I12-B2 is designed to support two different supply configurations, bipolar supply and unipolar supply.

In bipolar supply the driver is typically supplied with a positive voltage of 15 V at *VCC2* and a negative voltage of -8 V at *VEE2*. Negative supply prevents a dynamic turn on due to the additional charge which is generated from IGBT input capacitance times negative supply voltage. If an appropriate negative supply voltage is used, connecting *CLAMP* to IGBT gate is redundant and therefore typically not necessary.

For unipolar supply configuration the driver is typically supplied with a positive voltage of 15 V at *VCC2*. Erratically dynamic turn on of the IGBT could be prevented with active Miller clamp function, so *CLAMP* output is directly connected to IGBT gate.

**Figure 5**   **Application example unipolar supply**

3.2   Internal protection features

3.2.1   Undervoltage lockout (UVLO)

To ensure correct switching of IGBTs the device is equipped with an undervoltage lockout for both chips, refer to *Figure 9*.

If the power supply voltage V_{VCC1} of the input chip drops below V_{UVLOL1} a turn-off signal is sent to the output chip before power-down. The IGBT is switched off and the signals at *IN+* and *IN-* are ignored as long as V_{VCC1} reaches the power-up voltage V_{UVLOH1}.

If the power supply voltage V_{VCC2} of the output chip goes down below V_{UVLOL2} the IGBT is switched off and signals from the input chip are ignored as long as V_{VCC2} reaches the power-up voltage V_{UVLOH2}. *VEE2* is not monitored, otherwise negative supply voltage range from 0 V to -12 V would not be possible.

3.2.2 *RDY* ready status output

The *RDY* output shows the status of three internal protection features.

• UVLO of the input chip
• UVLO of the output chip after a short delay
• Internal signal transmission after a short delay

It is not necessary to reset the *RDY* signal since its state only depends on the status of the former mentioned protection signals.

3.2.3 Watchdog timer

During normal operation the internal signal transmission is monitored by a watchdog timer. If the transmission fails for a given time, the IGBT is switched off and the *RDY* ready output reports an internal error.

3.2.4 Active shut-down

The active shut-down feature ensures a safe IGBT off-state if the output chip is not connected to the power supply, IGBT gate is clamped at *OUT* to *VEE2*.

3.3 Non-inverting and inverting inputs

There are two possible input modes to control the IGBT. At non-inverting mode *IN+* controls the driver output while *IN-* is set to low. At inverting mode IN- controls the driver output while *IN+* is set to high, please see ***Figure 7***. A minimum input pulse width is defined to filter occasional glitches.

3.4 Driver output

The output driver sections uses only MOSFETs to provide a rail-to-rail output. This feature permits that tight control of gate voltage during on-state and short circuit can be maintained as long as the drivers supply is stable.

Due to the low internal voltage drop, switching behavior of the IGBT is predominantly governed by the gate resistor. Furthermore, it reduces the power to be dissipated by the driver.

3.5 External protection features

3.5.1 Desaturation protection

A desaturation protection ensures the protection of the IGBT at short circuit.

When the DESAT voltage goes up and reaches 9 V, the output is driven low. Further, the */FLT* output is activated after DESAT to fault-off delay, please refer to ***Figure 8***. An off command at *IN* during DESAT to fault-off delay is erasing the fault status. A programmable blanking time is used to allow enough time for IGBT saturation. Blanking time is provided by a highly precise internal current source and an external capacitor.

3.5.2 Active Miller clamp

In a half bridge configuration the switched off IGBT tends to dynamically turn on during turn on phase of the opposite IGBT. A Miller clamp allows sinking the Miller current across a low impedance path in this high dV/dt situation. Therefore in many applications, the use of a negative supply voltage can be avoided. During turn-off, the gate voltage is monitored and the clamp output is activated when the gate voltage goes below typical 2 V (related to $VEE2$). The clamp is designed for a Miller current up to 2 A.

3.5.3 Short circuit clamping

During short circuit the IGBTs gate voltage tends to rise because of the feedback via the Miller capacitance. An additional protection circuit connected to *OUT* and *CLAMP* limits this voltage to a value slightly higher than the supply voltage. A current of maximum 500 mA for 10 μs may be fed back to the supply through one of this paths. If higher currents are expected or a tighter clamping is desired external Schottky diodes may be added.

3.6 /RST reset

The reset input has two functions.

- *   */RST* is in charge of setting back the */FLT* output. If */RST* is low longer than a given time, */FLT* will be cleared at the rising edge of */RST*, refer to **Figure 8**; otherwise, it will remain unchanged
- *   */RST* works as enable/shutdown of the input logic, refer to **Figure 7**

4 Electrical parameters

4.1 Absolute maximum ratings

Note: *Absolute maximum ratings are defined as ratings, which when being exceeded may lead to destruction of the integrated circuit. Unless otherwise noted all parameters refer to GND1.*

Table 3   **Absolute maximum ratings**

Parameter	Symbol	Values		Unit	Note / Test condition
		Min.	Max.		
Positive power supply output side	V_{VCC2}	-0.3	20	V	**1)**
Negative power supply output side	V_{VEE2}	-12	0.3	V	**1)**
Maximum power supply voltage output side (V_{VCC2} - V_{VEE2})	V_{max2}	–	28	V	–
Gate driver output	V_{OUT}	V_{VEE2}-0.3	V_{VCC2}+0.3	V	–
Gate driver high output maximum current	I_{OUT}	–	2.4	A	$t = 2\,μs$
Gate & clamp driver low output maximum current	I_{OUT}	–	2.4	A	$t = 2\,μs$
Maximum short circuit clamping time	t_{CLP}	–	10	μs	$I_{CLAMP/OUT} = 500$ mA
Positive power supply input side	V_{VCC1}	-0.3	6.5	V	–

---

1   With respect to *GND2*.

Table 3   Absolute maximum ratings (continued)

Parameter	Symbol	Values Min.	Values Max.	Unit	Note / Test condition
Logic input voltages ($IN+$,$IN-$,$/RST$)	$V_{LogicIN}$	-0.3	6.5	V	–
Opendrain Logic output voltage ($/FLT$)	$V_{/FLT}$	-0.3	6.5	V	–
Opendrain Logic output voltage (RDY)	V_{RDY}	-0.3	6.5	V	–
Opendrain Logic output current ($/FLT$)	$I_{/FLT}$	–	10	mA	–
Opendrain Logic output current (RDY)	I_{RDY}	–	10	mA	–
Pin $DESAT$ voltage	V_{DESAT}	-0.3	V_{VCC2} +0.3	V	[1]
Pin $CLAMP$ voltage	V_{CLAMP}	-0.3	V_{VCC2} +0.3[2]	V	[3]
Input to output isolation voltage ($GND2$)	V_{offset}	-1200	1200	V	
Junction temperature	T_J	-40	150	°C	–
Storage temperature	T_S	-55	150	°C	–
Power dissipation, per input part	$P_{D, IN}$	–	100	mW	[4]@T_A = 25°C
Power dissipation, at output side	$P_{D, OUT}$	–	700	mW	[4] @T_A = 25°C
Thermal resistance (input side)	$R_{thJA,IN}$	–	160	K/W	[4] @T_A = 25°C
Thermal resistance (output side)	$R_{thJA,OUT}$	–	125	K/W	[4] @T_A = 25°C
ESD capability	$V_{ESD,HBM}$	–	1	kV	Human Body Model[5]

4.2   Operating parameters

Note: Within the operating range the IC operates as described in the functional description. Unless otherwise noted all parameters refer to GND1.

Table 4   Operating parameters

Parameter	Symbol	Values Min.	Values Max.	Unit	Note / Test condition
Positive power supply output side	V_{VCC2}	13	20	V	[6]
Negative power supply output side	V_{VEE2}	-12	0	V	[6]

---

1   With respect to *GND2*.
2   May be exceeded during short circuit clamping.
3   With respect to *VEE2*.
4   Output IC power dissipation is derated linearly at 10 mW/°C above 62°C. Input IC power dissipation does not require derating. See ***Figure 11*** for reference layouts for these thermal data. Thermal performance may change significantly with layout and heat dissipation of components in close proximity.
5   According to EIA/JESD22-A114-B (discharging a 100 pF capacitor through a 1.5 kΩ series resistor).
6   With respect to *GND2*.

4 Electrical parameters

Table 4   Operating parameters (continued)

Parameter	Symbol	Values		Unit	Note / Test condition
		Min.	Max.		
Maximum power supply voltage output side (V_{VCC2} - V_{VEE2})	V_{max2}	–	28	V	–
Positive power supply input side	V_{VCC1}	4.5	5.5	V	–
Logic input voltages (*IN+*,*IN-*,*/RST*)	$V_{LogicIN}$	-0.3	5.5	V	–
Pin *CLAMP* voltage	V_{CLAMP}	V_{VEE2}-0.3	V_{VCC2}[7]	V	–
Pin *DESAT* voltage	V_{DESAT}	-0.3	V_{VCC2}	V	[6]
Ambient temperature	T_A	-40	105	°C	–
Common mode transient immunity[8]	$|dV_{ISO}/dt|$	–	100	kV/µs	@ 1200 V

4.3   Recommended operating parameters

Note: Unless otherwise noted all parameters refer to GND1.

Table 5   Recommended operating parameters

Parameter	Symbol	Value	Unit	Note / Test condition
Positive power supply output side	V_{VCC2}	15	V	[9]
Negative power supply output side	V_{VEE2}	-8	V	[9]
Positive power supply input side	V_{VCC1}	5	V	–

---

[7]   May be exceeded during short circuit clamping.
[6]   With respect to *GND2*.
[8]   The parameter is not subject to production test - verified by design/characterization
[9]   With respect to *GND2*.

4.4 Electrical characteristics

Note: *The electrical characteristics include the spread of values in supply voltages, load and junction temperatures given below. Typical values represent the median values at $T_A = 25°C$. Unless otherwise noted all voltages are given with respect to their respective GND (GND1 for pins 9 to 16, GND2 for pins 1 to 8).*

4.4.1 Voltage supply

Table 6   **Voltage supply**

Parameter	Symbol	Values			Unit	Note / Test condition
		Min.	Typ.	Max.		
UVLO threshold input chip	V_{UVLOH1}	–	4.1	4.3	V	–

10 The parameter is not subject to production test - verified by design/characterization

4.4.5 Short circuit clamping

Table 10   **Short circuit clamping**

Parameter	Symbol	Values			Unit	Note / Test condition
		Min.	Typ.	Max.		
Clamping voltage (*OUT*) (V_{OUT} - V_{VCC2})	V_{CLPout}	–	0.8	1.3	V	*IN+* = High, *IN-* = Low, *OUT* = High I_{OUT} = 500 mA pulse test, t_{CLPmax} = 10 µs)
Clamping voltage (*CLAMP*) (V_{VCLAMP}-V_{VCC2})	$V_{CLPclamp}$	–	1.3	–	V	*IN+* = High, *IN-* = Low, *OUT* = High I_{CLAMP} = 500 mA (pulse test, t_{CLPmax} = 10 µs)
Clamping voltage (*CLAMP*)	$V_{CLPclamp}$	–	0.7	1.1	V	*IN+* = High, *IN-* = Low, *OUT* = High I_{CLAMP} = 20 mA

4.4.6 Dynamic characteristics

Dynamic characteristics are measured with V_{VCC1} = 5 V, V_{VCC2} = 15 V and V_{VEE2} = -8 V.

Table 11   **Dynamic characteristics**

Parameter	Symbol	Values			Unit	Note / Test condition
		Min.	Typ.	Max.		
Input *IN+*, *IN-* to output propagation delay ON	t_{PDON}	145	170	195	ns	C_{LOAD} = 100 pF V_{IN+} = 50%, V_{OUT}=50% @ 25°C
Input *IN+*, *IN-* to output propagation delay OFF	t_{PDOFF}	145	165	190	ns	
Input *IN+*, *IN-* to output propagation delay distortion (t_{PDOFF} - t_{PDON})	t_{PDISTO}	-35	-5	25	ns	
IN+, *IN-* input to output propagation delay ON variation due to temp	$t_{PDON,t}$	–	–	25	ns	[11]C_{LOAD} = 100 pF V_{IN+} = 50%, V_{OUT}=50%

---

[11]   The parameter is not subject to production test - verified by design/characterization

Table 11   **Dynamic characteristics (continued)**

Parameter	Symbol	Values			Unit	Note / Test condition
		Min.	**Typ.**	**Max.**		
IN+, *IN-* input to output propagation delay OFF variation due to temp	$t_{PDOFF,t}$	–	–	40	ns	[11]C_{LOAD} = 100 pF V_{IN+} = 50%, V_{OUT} = 50%
IN+, *IN-* input to output propagation delay distortion variation due to temp (t_{PDOFF}-t_{PDON})	$t_{PDISTO,t}$	–	–	20	ns	[11]C_{LOAD} = 100 pF V_{IN+} = 50%, V_{OUT}=50%
Rise time	t_{RISE}	10	30	60	ns	C_{LOAD} = 1 nF V_L 10%, V_H 90%
		200	400	800	ns	C_{LOAD} = 34 nF V_L 10%, V_H 90%
Fall time	t_{FALL}	10	50	90	ns	C_{LOAD} = 1 nF V_L 10%, V_H 90%
		200	350	600	ns	C_{LOAD} = 34 nF V_L 10%, V_H 90%

4.4.7   Desaturation protection

Table 12   **Desaturation protection**

Parameter	Symbol	Values			Unit	Note / Test condition
		Min.	**Typ.**	**Max.**		
Blanking capacitor charge current	I_{DESATC}	450	500	550	µA	V_{VCC2} =15 V, V_{VEE2}=- 8 V V_{DESAT} = 2 V
Blanking capacitor discharge current	I_{DESATD}	9	14	–	mA	V_{VCC2} =15 V, V_{VEE2} = -8 V V_{DESAT} = 6 V
Desaturation reference level	V_{DESAT}	8.3	9	9.5	V	V_{VCC2} = 15 V

---

11   The parameter is not subject to production test - verified by design/characterization

4 Electrical parameters

Table 12   Desaturation protection (continued)

Parameter	Symbol	Values			Unit	Note / Test condition
		Min.	Typ.	Max.		
Desaturation filter time	$t_{DESATfilter}$	–	250	–	ns	V_{VCC2} = 15 V, V_{VEE2} = -8 V, V_{DESAT} = 9 V
Desaturation sense to *OUT* low delay	$t_{DESATOUT}$	–	350	430	ns	V_{OUT} = 90% C_{LOAD} = 1 nF
Desaturation sense to */FLT* low delay	$t_{DESATFLT}$	–	–	2.25	µs	$V_{/FLT}$ = 10%; $I_{/FLT}$ = 5 mA
Desaturation low voltage	V_{DESATL}	0.4	0.6	0.95	V	*IN+* = low, *IN-* = low, *OUT* = low
Leading edge blanking	$t_{DESATleb}$	–	400	–	ns	Not subject of production test

4.4.8 Active shut-down

Table 13 **Active shut-down**

Parameter	Symbol	Values			Unit	Note / Test condition
		Min.	**Typ.**	**Max.**		
Active shut-down voltage	V_{ACTSD}[12]	–	–	2.0	V	I_{OUT} = -200 mA, V_{VCC2} open

---

12 With reference to *VEE2*

5 Insulation characteristics

Insulation characteristics are guaranteed only within the safety maximum ratings which must be ensured by protective circuits in application. Surface mount classification is class A in accordance with CECCOO802.

This coupler is suitable for rated insulation only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.

5.1 Tested according to VDE 0884-10 (Standard expired on Dec. 31, 2019)

Since the standard has expired on December 31, 2019, the product and its testing has not been changed.

Table 14   According to VDE 0884-10 (Standard expired on Dec. 31, 2019)

Description	Symbol	Characteristic	Unit
Installation classification per EN 60664-1, Table 1 for rated mains voltage ≤ 150 V (rms) for rated mains voltage ≤ 300 V (rms) for rated mains voltage ≤ 600 V (rms)		I-IV I-III I-II	–
Climatic classification (IEC68-1)		40/105/21	–
Pollution degree (EN 60664-1)		2	–
Minimum external clearance	CLR	8.12	mm
Minimum external creepage	CPG	8.24	mm
Minimum comparative tracking index	CTI	175	–
Maximum repetitive insulation voltage	V_{IORM}	1420	V (pk)
Input to output test voltage, method b[13] V_{IORM} * 1.875 = V_{PR}, 100% production test with t_m = 1 sec, partial discharge < 5 pC	V_{PR}	2663	V (pk)
Input to output test voltage, method a[13] V_{IORM} * 1.6 = V_{PR}, 100% production test with t_m = 60 sec, partial discharge < 5 pC	V_{PR}	2272	V (pk)
Highest allowable overvoltage	V_{IOTM}	6000	V (pk)
Maximum surge insulation voltage	V_{IOSM}	6000	V
Insulation resistance at T_S, V_{IO} = 500 V	R_{IO}	> 10^9	Ω

5.2 Recognized under UL 1577 (File E311313)

Table 15   Recognized under UL 1577

Description	Symbol	Characteristic	Unit
Insulation withstand voltage / 1 min	V_{ISO}	3750	V (rms)
Insulation test voltage / 1 s	$V_{ISO,test}$	4500	V (rms)

---

13   Refer to VDE 0884 for a detailed description of Method a and Method b partial discharge test profiles.

8 Application notes

8.1 Reference layout for thermal data

The PCB layout shown in **Figure 11** represents the reference layout used for the thermal characterization. Pins 9 and 16 (*GND1*) and pins 1 and 8 (*VEE2*) require ground plane connections for achieving maximum power dissipation. The 1ED020I12-B2 is conceived to dissipate most of the heat generated through this pins.
Figure 11   **Reference layout for thermal data (Copper thickness 102 µm)**

8.2   Printed circuit board guidelines

Following factors should be taken into account for an optimum PCB layout.

- Sufficient spacing should be kept between high voltage isolated side and low voltage side circuits.
- The same minimum distance between two adjacent high-side isolated parts of the PCB should be maintained to increase the effective isolation and reduce parasitic coupling.
- In order to ensure low supply ripple and clean switching signals, bypass capacitor trace lengths should be kept as short as possible.
- Lowest trace length for *VEE2* to *GND2* decoupling could be achieved with capacitor closed to pins 1 and 3.

9 Revision history

Document version	Date of release	Description of changes
v2.2	2020-01-01	• Update to new template • Editorial changes to headlines, descriptions and figures • Update to VDE 0884-10 expiration date, product and testing have not been changed
v2.1	2017-09-28	• Upgrade common mode transient immunity rating to 100 kV/µs, change typo $|DV_{ISO}/dt|$ to $|dV_{ISO}/dt|$ • Editorial changes to headlines, descriptions and figures
